Information

It is one of Serbia's most important infrastructural projects, financed from the National Investment Plan with the financial backing of European Bank for Reconstruction and Development and European Investment Bank. Its construction is expected to alleviate Belgrade's congestion problems, and remove all transit traffic from the city center, unloading the critical Gazela and Pan?evo bridges. The total length of the bypass will be 69 kilometers.

The bypass was planned by the Belgrade's general urbanistic plan, and its parts have been sporadically built for 17 years. However, the works intensified around the end of 2005. The total investment is estimated at euro 543 million, with around € 370 million remaining. Of those, 55 million come from the EBRD, 180 from the EIB, and the remainder from the National Investment Plan.
